Severe food shortage to hit Pakistan in coming years

QUETTA: If Pakistan did not take immediate measures there will be severe food shortage in the country in the coming years due to small rains.

These views were expressed by Manager Pakistan Agro Development International Dr Pervez Amir at closing session of three-day training course for relevant provincial government departments here Wednesday.

The course was organized by IUCN in collaboration with Balochistan Environmental Protection Agency and Stockholm Institute of environment UK. Clean Air initiative for Asian Cities (CAI-Asia) and Community Health Sciences Department of Aga Khan University.

A large number of environmental experts from Pakistan and abroad attended this training course.

Dr Pervez Amir said that human beings have established factories all over the world for development. Gas emission from these factories has not only increased environmental pollution but also entire world particularly Pakistan has affected the worst. Pakistan has now included in Red zone of environmental changes causing more rains and floods in several parts of the country where weather has also become hot. This has also resulted in water problems and agriculture has suffered the most. Despite an agrarian country, Pakistan was facing severe crisis of atta, sugar and other food items for this situation.

He said if Pakistan did not raise voice against these changes then people would be forced to migrate from their own areas to other parts in the days to come.

Dr Pervez Amir strongly protested allotment of land to Arab countries in Pakistan for agriculture and said that Arab countries are not interested with the development of Pakistan but they wanted to use water from glaciers of the country.

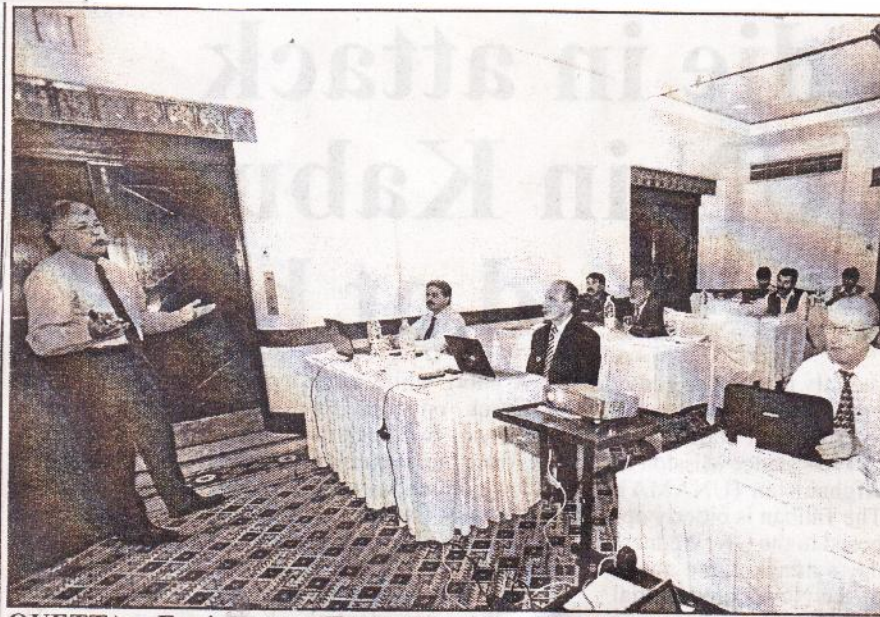

He said Pakistan should setup power stations to meet its energy needs so that people could get employment opportunities in the face of factories.

Professor Computer Science of Balochistan University Mohtarma Saira Shafiq Malik said that environmental pollution has affected health of the people in Pakistan and cancer, and diseases of stomach, eyes and lungs were spreading speedily. Every second person is also suffering from colds, flu and cough. She was of the opinion that women, children, aged persons and traffic police officials were worst sufferers due to environmental pollution in Quetta.

Programme manager IUCN Zabardast Khan Bangash said government should take steps for the environmental pollution and atmospheric changes. Special attention should be paid on health sector so that lives of women, children and aged persons could be saved.

Certificates and souvenirs were also distributed among the participants. -PPI
